Attempt all the questions.

CLO3 Design a conceptual model using ER Model for an enterprise

Draw an ER diagram for the following scenario. Make sure that you indicate all cardinality constraints and your model should not contain redundant entity sets, relationships, or attributes. Clearly state any relevant assumptions you make; unnecessary or irrelevant assumptions will result in deduction of marks.

The company wants to digitize project work logs. You are asked to design the database for submitting and approving work logs. A work log should have hours worked and date submitted. Each work log is associated with exactly one worker. A worker can either be permanent or contract-based. Each work log should have a unique id. Each work log has a status: approved, not approved, or pending. Each worker has a unique id, name, and address. Each worker submits a work log every reporting period; hence, in a year, they will submit multiple work logs. Each worker has either bank transfer or cash as their method of payment. Each worker is associated with exactly one supervisor. Each supervisor has a unique id and a name. Each supervisor is responsible for multiple workers and approves work logs for multiple workers.
